p_t	τ_c
1.5	0.75
1.456231884	0.74649855
2	0.79
Design shear stress, τ_c	$0.74649855 \text{ N/mm}^2$

$$\tau_v > \tau_c$$

Hence not safe

Hence provide shear reinforcement

$$\begin{aligned}
 V_{us} &= v_u - \tau_c bd \\
 &= 139819.06 \text{ N} \\
 &= 139.81906 \text{ kN} \\
 \text{Use } 2 \text{ legged } 8 \text{ mm dia bars} \\
 A_{sv} &= 100.48 \text{ mm}^2
 \end{aligned}$$

$$S_v = (0.87 \cdot f_y \cdot A_{sv} \cdot d) / v_{us}$$

$$= 150.052675 \text{ mm}$$

$$= 150 \text{ mm}$$

$$S_v > 0.75d$$

$$= 360 \text{ mm}$$

Adopt

2 legged 8 mm dia bars
@ 150 mm c/c near the support &
350 mm c/c at mid-span.

CHECK FOR DEFLECTION:

$$(l/d)_{act} = 10.625$$

$$(l/d)_{max} = (l/d)_{basic} \cdot k_t \cdot k_c \cdot k_f$$

$$p_t = 1.45623188$$

$$p_c = 0.36405797$$

Referring the diagram,

$$k_t = 0.93$$

$$k_c = 1.1$$

$$k_f = 1$$

$$\text{Therefore, } (l/d)_{max} = 20.46$$

Hence safe against deflection
